Luxembourg SICAV sub-fund

R. Ouahba

D. Older

K. Ney

FACT SHEET
04/2022

Recommended minimum investment horizon:

3 years

Investment Objective

A mixed fund tapping into three performance drivers: international bonds, international equities and currencies. At least 40% of its assets are invested in fixed income products and money market instruments at all times. Its flexible allocation aims to mitigate capital fluctuation while seeking sources of return. The Fund aims to outperform its reference indicator over 3 years.

Fund Management analysis can be found on P.4

FUND MANAGEMENT ANALYSIS

Market environment

In April, equity markets posted their sharpest monthly decline since March 2020, even though quarterly earnings were generally better than expected. As in the first part of the year, equity markets remain guided by macroeconomics and, to a lesser extent, companies' fundamentals. In the United States and Europe, central bankers are worried about raised inflation expectations, and have reaffirmed their determination to do whatever it takes to manage price rises. This firmness soon put yields under pressure, leading to a decline not just in risky assets but also traditional safe havens. Both government and corporate bond markets dropped further. The Bloomberg Global Aggregate index, which is the key measure of global investment grade debt, was down 5.5% in April and 11.3% year-to-date, its worst correction since 1980.

Performance commentary

Although we suffered overall from the markets' broad decline, we managed to limit the damage by actively managing our exposure. For example, short equity index positions taken to reduce the strategy's exposure counterbalanced the performance of our equity portfolio. This showed strength in its healthcare, consumer staples and energy stocks, which we have increased in recent weeks, whereas our consumer discretionary exposure – though reduced – proved costly. Bond markets worried about a Russian default last month, although the country ultimately avoided this at the beginning of May by using its US currency reserves. The situation weighed on our portfolio's remaining Russian assets in April, government and corporate bonds alike. However, our credit index hedges helped limit this volatility.

Outlook and Investment strategy

If the markets do not expect inflation to peak, they will remain in a period of adjustment and instability, So we think it best to keep equity exposure low. We are also preparing the portfolio for a situation in which companies' fundamentals return to the forefront, against a backdrop of weak inflation and persistently higher inflation. We are focusing on equity investments in defensive stocks (healthcare and consumer staples), quality stocks, companies profiting from the energy transition and meeting our ESG criteria, and the tourism industry which is benefiting from the lifting of restrictions on international travel. We reduced our credit allocation and increased our hedging, while keeping an allocation to structured credit. Latin American countries, which are further along in the monetary tightening process, are benefiting from generally higher commodity prices. We are holding positions on Brazilian local currency debt, and on the Chilean and Mexican pesos.

GLOSSARY

Alpha: Alpha measures the performance of a portfolio compared to its reference indicator. Negative alpha means the fund performed less well than its reference indicator (e.g. if the indicator increased by 10% in one year and the fund increased by only 6%, its alpha is -4). Positive alpha means the fund performed better than its reference indicator (e.g. if the indicator increased by 6% in one year and the fund increased by 10%, its alpha is 4).

Beta: Beta measures the relationship between the fluctuations of the net asset values of the fund and the fluctuations of the levels of its reference indicator. Beta of less than 1 indicates that the fund "cushions" the fluctuations of its index (beta = 0.6 means that the fund increases by 6% if the index increases by 10% and decreases by 6% if the index falls by 10%). Beta higher than 1 indicates that the fund "magnifies" the fluctuations of its reference indicator (beta = 1.4 means that the fund increases by 14% when the index increases by 10% but also decreases by 14% when the index decreases by 10%). Beta of less than 0 indicates that the fund reacts inversely to the fluctuations of its reference indicator (beta = -0.6 means that the fund falls by 6% when the index increases by 10% and vice versa).

Capitalisation: A company's stock market value at any given moment. It is obtained by multiplying the number of shares of a company by its stock exchange price.

Duration: A bond's duration is the period beyond which interest rate variations will no longer affect its return. The duration is like a discounted average lifetime of all flows (interest and capital).

FCP: Fonds commun de placement (French common fund).

High yield: A loan or bond rated below investment grade because of its higher default risk. The return on these securities is generally higher.

Investment grade: A loan or bond that rating agencies have rated AAA to BBB-, generally indicating relatively low default risk.

Investment/exposure rate: The investment rate constitutes the volume of assets invested expressed as a percentage of the portfolio. Adding the impact of the derivatives to this investment rate results in the exposure rate, which corresponds to the real percentage of asset exposure to a certain risk. Derivatives can be used to increase the underlying asset's exposure (stimulation) or reduce it (hedging).

Modified duration: A bond's modified duration measures the risk attached to a given change in the interest rate. Modified duration of +2 means that for an instantaneous 1% rate increase, the portfolio's value would drop by 2%.

Net asset value: Price of all units (in an FCP) or shares (in a SICAV).

Rating: The rating measures the creditworthiness of a borrower (bond issuer). Ratings are published by rating agencies and offer the investor reliable information on the risk profile associated with a debt security.

Sharpe ratio: The Sharpe ratio measures the excess return over the risk-free rate divided by the standard deviation of this return. It thus shows the marginal return per unit of risk. When it is positive, the higher the Sharpe ratio, the more risk-taking is rewarded. A negative Sharpe ratio does not necessarily mean that the portfolio posted a negative performance, but rather that it performed worse than a risk-free investment.

SICAV: Société d'Investissement à Capital Variable (Open-ended investment company with variable capital)

VaR: Value at Risk (VaR) represents an investor's maximum potential loss on the value of a financial asset portfolio, based on a holding period (20 days) and confidence interval (99%). This potential loss is expressed as a percentage of the portfolio's total assets. It is calculated on the basis of a sample of historical data (over a two-year period).

Volatility: Range of price variation of a security, fund, market or index, which enables the measurement of risk over a given period. It is determined using the standard deviation obtained by calculating the square root of the variance. The variance is obtained by calculating the average deviation from the mean, which is then squared. The greater the volatility, the greater the risk.

Yield to Maturity: Yield to maturity corresponds to the concept of actuarial yield. It is, at the time of calculation, the rate of return offered by a bond in the event it is held until maturity by the investor.

ESG DEFINITIONS & METHODOLOGY

ESG: E for Environment, S for Social, G for Governance

ESG score Calculation: Only the Equity and Corporate Bond holdings of the fund considered. Overall Fund Rating calculated using MSCI Fund ESG Quality Score methodology: excluding cash and non ESG-rated holdings, performing a weighted average of the normalized weights of the holdings and the Industry-Adjusted Score of the holdings, multiplied by (1+Adjustment%) which consists of the weight of positively trending ESG ratings minus the weight of ESG Laggards minus the weight of negatively trending ESG ratings. For a detailed explanation see "MSCI ESG Fund Ratings Methodology", Section 2.3. Updated June 2021.

<https://www.msci.com/documents/1296102/1538811/MSCI+ESG+Fund+Ratings+Exec+Summary+Methodology.pdf/ec622acc-42a7-158f-6a47-ed7aa4503d4f?t=1562690846881>.

Main risks of the fund

Equity: The Fund may be affected by stock price variations, the scale of which is dependent on external factors, stock trading volumes or market capitalization. **Interest rate:** Interest rate risk results in a decline in the net asset value in the event of changes in interest rates. **Credit:** Credit risk is the risk that the issuer may default. **Currency:** Currency risk is linked to exposure to a currency other than the Fund's valuation currency, either through direct investment or the use of forward financial instruments. The Fund presents a risk of loss of capital.
